**Raptor Claw and Velociraptor Teeth for Sale**

In mammalian oral anatomy, the canine teeth, also called cuspids, dog teeth, or (in the context of the upper jaw) fangs, eye teeth, vampire teeth, or vampire fangs, are the relatively long, pointed teeth. They can appear more flattened however, causing them to resemble incisors and leading them to be called incisiform. They developed and are used primarily for firmly holding food in ...

**Sthenurus - Wikipedia**
Sthenurus ("strong tail") is an extinct genus of kangaroos. With a length around 3 m (10 ft), some species were twice as large as modern extant species. Sthenurus was related to the better-known Procoptodon. The subfamily Sthenurinae is believed to have separated from its sister taxon, the Macropodinae (kangaroos and wallabies), halfway through the Miocene, and then ...

**Canine tooth - Wikipedia**
In mammalian oral anatomy, the canine teeth, also called cuspids, dog teeth, or (in the context of the upper jaw) fangs, eye teeth, vampire teeth, or vampire fangs, are the relatively long, pointed teeth. They can appear more flattened however, causing them to resemble incisors and leading them to be called incisiform. They developed and are used primarily for firmly holding food in...
The Dromaeosaurs probably hunted in packs and may have been feathered. Fossil remains include well preserved teeth, bones, and claws, and are highly valued by collectors. These top quality specimens were all legally collected from private lands in the northwestern US. Late Cretaceous, Hell Creek Fm. (or equivalent), 68-66 MYA.

**Authenticity**

**Mammals - Our World in Data**
Summary. Wild mammal biomass has declined by 85% since the rise of human civilizations. This was mainly driven by overhunting and habitat loss. Wild animals only make up 4% of the world’s mammals; humans account for 34%, and our livestock for 62%.

**Python | San Diego Zoo Animals & Plants**
It grabs its prey with its teeth, then quickly wraps coils of its body around the prey and squeezes. The python doesn’t actually crush the prey and break its bones, though. Instead, it squeezes tightly so that its prey can’t breathe; each time its prey exhales, the constrictor tightens its coils to take up space, causing suffocation.
